cleaves insulin B chain at 6-Leu-|-Cys-7, 16-Tyr-|-Leu-17, 25-Phe-Tyr-26, and 26-Tyr-|-The-7. Could play a role in the activation of precursors to inflammarcry cytokines.

TISSUE SPECIFICITY: Abundantly expressed in the skin and is expressed by keratinocytes in the epidermis. Very low levels are also seen in the brain and kidney.

SIMILARITY: Belongs to peptidase family S1. Kallikrein subfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          21-JUL-1986 (Rel. 01, Created)

SUBCELLULAR LOCATION: Secreted.

SUBCELLULAR LOCATION: Expressed specifically in the limbic system of TISSUE SPECIFICITY: Expressed specifically in the limbic system of mouse brain and is localized at highest concentration in pyramidal neurons of the hippocampal CA1-3 subfields.

MASS SPECTROMETRY: NWw-26613; NETHOD=NALDI; RANGE=29-260.

MASS SPECTROMETRY: NWw-26229, METHOD=NALDI; RANGE=33-260.

MASS SPECTROMETRY: NWW-26229; METHOD=NALDI; RANGE=33-260.

MASS SPECTROMETRY: Ma-26229; METHOD=NALDI; RANGE=33-260.

SIMILARITY: Belongs to peptidase family S1. Rallikrein subfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CATALYTIC ACTIVITY: Preferential cleavage: Arg-, Lys-.
ENZYME REGULATION: Strongly inhibited by dIIsopropyl
fluorophosphate, leupeptin and (4-amidinophenyl)methanesulfonyl 1-
                                                                                                                                                                                                                                                                                                                                                        TISSUE-Hippocampus;

"Characterization of one novel venom protease with beta-fibrinogenase activity from the Taiwan habu (Trimeresurus mucrosquamatus): purification and cDNA sequence analysis.";
Biochem Biophys. Res . Commun. 205:107-1715 (1994).
-!- FUNCTION: Thrombin-like snake venom serine protease. Cleaves beta-chain of fibrinogen molecules efficiently and shows relatively lower activity on alpha-chain, with almost no activity on gamma-
                                                                                                                                                     -!- SUBCELLULAR LOCATION: Secreted.
-!- TISSUE SPECIFICITY: Expressed by the venom gland.
-!- SIMILARITY: Belongs to peptidase family S1. Snake venom subfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Eukaryota; Merazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

                                                                                                                                                                                                                                                                                                                                                                                                                Fraser C.M.;
"Complete genome sequence and comparative analysis of the
metabolically versatile Pseudomonas putida KT2440.";
metabolically versatile Pseudomonas putida KT2440.";
Environ. Microbiol. 4:799-808(2002).
-!- FUNCTION: Functions in the N-end rule pathway of protein
degradation where it conjugates Arg from its aminoacy1-tRNA to th
N-termini of proteins containing an N-terminal aspartate or
glutamate (Potential).
-!- CATALXTIC ACTIVITY: L-arginy1-tRNA + protein = tRNA + L-arginy1-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Homo sapiens (Human).

	Diagnosing cancer comprises detecting stratum corneum chymotrypsin
PT enzyme.	
AAA Claim 25; Page 103; 127pp; English.	English.
_	The invention relates to diagnosing cancer especially ovarian cancer, by
	stratum corneum chymotrypsin enzyme (SCCE). Proteases are
CC considered to be an integr	ğ,
	ive of their presence or absence are useful for
	cancer. The method is useful for diagnosing cancer,
	perplasia. The SCCE oligonucleotide may be used
	to treat a cancer selected irom ovarian, breast, immy, colom, prostate and other cancers in which SCCR is overexpressed. The present sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               39-MAY-2002
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              10-APR-2003
                                                                                                                                                                                                                         ADA05736;
                                                                                                                                                               ADA0573
                                                                                                                                                                                                       8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, ollgomers, and for chomosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in issue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving abservant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, formalic for generatic disorders or other traits to assess biodiversity responsible for generatic disorders or other traits to assess biodiversity and to cid sequences. Abgonolo-Abg30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from MIPO at (It) whip. int/pub/published_pot_sequences

WO2003029424-A2

The present invention describes NOVX proteins, where X can be 1 to 55 cego. NOV1) Also described: (1) a composition comprising a polypeptide described above and a cartier; (2) a kit comprising, in one or more centainers, the composition described above; (3) an isolated nucleic acid molecule which encodes a NOVX protein of the invention; (4) a vector comprising the nucleic acid molecule described above; (5) a cell comprising the nucleic acid molecule described above; (5) a cell comprising the business of the polypeptide described above; (5) a cell comprising the business of the polypeptide described above; (5) a cell compression of the above polypeptide or nucleic acid molecule in a first mammalian subject; (9) a method for identifying an agent that binds to the polypeptide described above; (10) a method for identifying a potential therapeutic agent for above; (10) a method for identifying a pathology that is related to an aberrant expression of the above polypeptide or modulator of activity or of latency or predisposition to a pathology associated with the polypeptide; (11) a method of a pathology associated with the polypeptide; (12) a method for modulation or compression of the polypeptide; (13) a method for modulation or preventing a pathology associated with the above polypeptide; uncorrective, antipacting or preventing a pathology associated with the above polypeptide; uncorrective, antipacting or protein and antilipacemic activities, and can be used in gene therapy. The polypeptide is useful in menufacturing a medicament; or prevent metabolic and molecule may be used to diagnose, treat or prevent metabolic activities, and can be used in gene therapy. The polypeptide is useful in menufacturing a medicament; or prevent metabolic activities, had menufolement and insorders and variance or obesity, infections, cancer, calculation and disorders become associated with a human disease. The polypeptide or prevent metabolic disorders under a plabetes or obesity, infections, cancer, in probes, in chromosome mapping New NOVX polypeptides and nucleic acids, useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. diabetes, obesity, cancer or dyslipidemia, and in chromosome mapping, tissue typing or Claim 1; Page 170; 586pp; English.

New NOVX polypeptides and nucleic acids, useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. diabetes, cancer or dyslipidemia, and in chromosome mapping, tissue typing

obesity, or

Claim 1; Page 169-170; 586pp; English

pharmacogenomics

The present invention describes NOVX proteins, where X can be 1 to 55

(e.g. NOVI). Also described: (1) a composition comprising a polypeptide
described above and a carrier; (2) a kit comprising, in one or more
containers, the composition described above; (3) an isolated nucleic acid
molecule which encodes a NOVX protein of the invention; (4) a vector
comprising the mucleic acid molecule described above; (5) a cell
comprising the polypeptide described above; (5) a cell
prise to the polypeptide described above; (7) methods for determining the
presence or amount of the above polypeptide or nucleic acid molecule in a
sample; (8) methods for determining the presence of or predisposition to
a disease associated with altered levels of expression of the above
copypeptide or nucleic acid molecule in a first mammalian subject; (9) a
method of identifying an agent that binds to the polypeptide described
above; (10) a method for identifying a potential therapeutic agent for
the intracting a pathology that is related to an aberrant expression or
aberrant physiclogical interactions of the polypeptide; (11) a method of
screening for a modulator of activity or of latency or predisposition to

Sequence 253 AA;

field.)

```
a pathology associated with the polypeptide; (12) a method for modulating the activity of the polypeptide described above; (13) methods of treating or preventing a pathology associated with the above polypeptide. Norward and (14) a method for producing the above polypeptide. Norward sequences have antidabetic, anorectic, antibacterial, virucide, immunomodulator, cytostatic, noorectic, antibacterial, virucide, and antilipaemic activities, and can be used in gene therapy. The polypeptide is useful in manufacturing a medicament for treating a polypeptide is useful, in manufacturing a medicament for treating a acid molecule may be used to diagnose, treat or prevent metabolic alsorders such as diabetes or obesity, infections, cancer, neurodegenerative disorders such as Alzheimer's disease or Parkinson's disease, immune disorders used as Alzheimer's disease or Parkinson's disease, immune disorders, haematopoietic disorders and various pharmacogenomics. The present sequence represents a human NOVX from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           present invention.

Nucleotide sequences encoding stratum corneum chymotryptic enzyme - and related vectors, transformed cells and polypeptides, useful for treating skin disorders, e.g. acne or psoriasis, and for identification of specific inhibitors.

Disclosure, Page 97; 137pp; English.

The enzyme encoded by this sequence is used in pharmaceutical, cosmetic and skin care products, especially to treat and prevent acne, xeroderma, or other hyperkeratotic conditions (e.g. callosities or keratosis pilaris), ichthyoses, psoriasis, eczema, etc. It is produced recombinantly following mammal, insect, plant, or microorganism transformation with plasmid p5507. Transgenic mammal or its embryo useful as model for human disease, has heterologous nucleotide sequence coding for stratum corneum chymotryptic enzyme operably linked to promoter that drives its expression in skin.

Example 6; Page 37; 74pp; English.

This invention describes a novel non-human transgenic mammal or mammalian embryo having integrated within its genome, a heterologous nucleotide sequence comprising at least a significant part of a mucleotide sequence coding for a stratum corneuw chymotryptic enzyme (SCCE) or its variant, operably linked to a promoter that drives expression of heterologous scce or its variant in skin. The product of the invention is useful as a model for the study of disease with the aim of improving treatment, to relieve or ameliorate a pathogenic condition, for development or testing of a cosmetic or a pharmaceutical formulation, and for the development of a diagnostic method. It can also be used as a model for skin disease or skin cancer. The invention is also useful for screening or identifying a compound or composition effective for the prevention or treatment of an abnormal or unwanted phenotype, and for screening or identifying a compound or composition effective for the prevention or treatment of inflammatory skin diseases selected from diseases consisting of epidermal compounds at opic dermatitis, eczema, acne and inherited skin diseases with epidermal hyperkratosis. The mammal of the invention is also useful as a model for further studies of itch mechanisms and the testing of potential compounds and compositions for relieve of various skin diseases where itch is a component. This sequence represents the N-terminal compounds with human variation compound conteum corneum fragment of the human stratum corneum chymotryptic enzyme, SCCE synonymous with human kallikrein 7 (KLK7), used in the development of the transgenic mammals described in the invention

Transgenic mammal or its embryo useful as model for human disease, has heterologous nucleotide sequence coding for stratum corneum chymotryptic enzyme operably linked to promoter that drives its expression in skin.

Claim 10; Page 58-59; 74pp; English.

This invention describes a novel non-human transgenic mammal or mammalian embryo having integrated within its genome, a heterologous nucleotide endrowed at least a significant part of a nucleotide sequence coding for a stratum corneum chymotryptic enzyme (SCCE) or its variant, operably linked to a promoter that drives expression of heterologous scce or its variant in skin. The product of the invention is useful as a model or ameliorate a pathogenic condition, for development or testing of a cosmetic or a pharmaceutical formulation, and for the development of a diagnostic method. It can also be useful for screening or identifying a compound or composition effective for the prevention or identifying a compound or composition effective for the prevention or treatment of an compound or composition effective for the prevention or treatment of inflammatory skin diseases selected from diseases consisting of epidermal contrus, atopic dermatitis, eczema, acne and inherited skin diseases with epidermal hyperkeratosis. The mammal of the invention is also useful contraction or for further studies of itch mechanisms and the testing of epidermal and now more and inherited skin diseases and inherited skin diseases and now more and inherited skin diseases and now more and inherited skin diseases and now more and the testing of epidermal and more and inherited skin diseases and now more and inherited skin diseases and inherited skin diseases and inherited skin diseases and inherited skin diseases and inhe potential compounds and compositions for relieve of various skin diseases where itch is a component. This sequence represents the human stratum corneum chymotraptic enzyme, SCCE which is a serine protease synonymous with human kallikrein 7 (KLK7) and is used in the development of the transgenic mammals described in the invention

Nucleic acids encoding novel human proteases, useful for useful for treating diseases and disorders such as cancers, immune-related diseases and disorders, cardiovascular disease (e.g. restenosis) and inflammatory disorders.

Claim 6; Fig 2N; 313pp; English.

The present invention relates to the isolation of novel human proteases, and the nucleic acids encoding them. The sequences of the invention are useful for treating diseases and disorders such as cancers (e.g. breast, colon, lung), immune-related diseases and disorders (e.g. inflammatory diseases and astima), cardiovascular diseases (e.g. inflammatory diseases, metabolis, brain or neuronal-associated diseases, metabolic disorders (e.g. diabetes, obesity), inflammatory disorders (e.g. diabetes, obesity), inflammatory disorders (e.g. disorders, pain, sexual dysfunction, mood disorders, attention disorders, neurological disorders, hypotension, hypertension, psychotic disorders, neurological disorders (e.g. Alzheiner's disease, Parkinson's disease) and dyskinesias. The nucleic acids and polypeptides are also virus (HIV), and non-viral infections caused by human immunodeficiency glaucoma) and macular degeneration. AAU82702-AAU82760 represent the novel human proteases of the invention

WPI; 2003-058520/05. N-PSDB; ABX10343 Novel genes which are differentially regulated in prostate cancer, useful for diagnosing prostate cancer in prostate tissue sample and assessing therapeutic or preventive intervention in prostate cancer patients.

Claim 1; Page 293-294; 416pp; English.

The invention describes genes (I) which are differentially regulated in prostate cancer. (I) is useful for diagnosing a prostate cancer in a sample comprising prostate tissue, which involves determining the number of the probability that the sample comprises the number of the probability that the sample comprises the number is indicative of the probability that the sample comprises or the number is indicative of the probability that the sample comprises or prevention in a subject having a prostate cancer. Which involves determining the expression levels in a sample comprising prostate tissue of target genes which are differentially-regulated in prostate cancer. (I) is also useful for identifying agents that modulate a biological activity of a polypeptide differentially-regulated in prostate cancer cells, which involves contacting a polypeptide differentially-regulated in prostate cancer cells with a test agent under conditions effective for the test agent to modulate a biological activity of the polypeptide, and determining whether the test agent modulates the biological activity. (I) to useful as molecular markers, as drug targets, and for detecting, or useful as molecular markers, as drug targets, and for detecting, or products are used in the diagnostic test to assay for presence of cancer. (I) is useful and the diagnostic test to assay for presence of cancer of cancer, its stage of development, the nature of genetic defect, etc. (I) is useful for assessing cancer e.g., to determine the type of earching specific binding partners of the polypeptide and thus of specific genes, and groups of genes a target for therapy or drug discovery. (I) can also be used for expressing the polypeptide and thus of specific genes, and groups of genes, expressed in pathways of the polypeptide and in the diagnostic prostate cancer. The identification of specific genes, and groups of genes, expressed in pathways and the delineation of targets in these pathways which are useful in diagnostic, therapeutic, and croup of genes of a p regulated in prostate cancer

The invention describes genes (I) which are differentially regulated in prostate cancer. (I) Is useful for diagnosing a prostate cancer in a sample comprising prostate tissue, which involves determining the number of target genes which are differentially regulated in the sample, where the number is indicative of the probability that the sample comprises for prostate cancer. (I) Is useful for assessing a therapeutic or prevention in a subject having a prostate cancer, which involves determining the expression levels in a sample comprising prostate tissue of trayet genes which are differentially-regulated in prostate cancer. Preferably, the expression levels in a sample comprising prostate tissue (I) is also useful for identifying agents that modulate a biological activity of a polypeptide differentially-regulated in prostate cancer cells, which involves contacting a polypeptide differentially-regulated in prostate cancer cells, which a test agent under conditions effective for the test agent to modulate a biological activity of the polypeptide, and determining whether the test agent modulates the biological activity. (I) is useful as markers, as drug targets, and for detecting. diagnosing, stading, grading, gasessing, monitoring, prognosticating, preventing or treating, determining predisposition to diseases and conditions especially relating to prostate cancer. (I) and its expression products are used in the diagnostic test to assay for presence of cancer e.g., in tissue sections, in biopsy sample, in total RNA, in lymph, in blood etc. (I) is useful for assessing cancer e.g., to determine the type of cancer, its stage of development, the nature of genetic defect, etc. The polypeptide encoded by (I) can be used as target for therapy or drug discovery. (I) can also be used for expressing the polypeptide and thus

The polynucleotides of the invention have cytostatic activity, and may have a use in gene therapy, and in a vaccine. The composition and methods are useful in diagnosing and/or treating cancer, particularly ovarian cancer. The composition may also be used as a vaccine to prevent cancer. The present sequence is used in the exemplification of the invention
for searching specific binding partners of the polypeptide. (I) is useful in therapeutic applications to treat prostate cancer. The identification of specific genes, and groups of genes, expressed in pathways physiologically relevant to prostate cancer permits the definition of bunctional and disease pathways and the delineation of targets in these pathways which are useful in diagnostic, therapeutic, and clinical applications. This is the amino acid sequence of a protein diferentially regulated in prostate cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New polynucleotide and polypeptide useful for diagnosing and/or treating cancer, particularly ovarian cancer, and as a vaccine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human stratum corneum chymotryptic enzyme - ovarian cancer clone O1676P.
                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a method of detecting an ovarian cancer-
associated transcript in a cell from a patient, by contacting a
biological sample from the patient with a polynucleotide that selectively
hybridizes to a sequence at least 80% identical to any of one of 80
nucleic acid sequences given in the specification. The method is useful
in diagnosing ovarian cancer and in identifying and using agents and/or
targets that inhibit ovarian cancer. The nucleic acid molecule,
polypeptide and the antibody may also be used in detecting ovarian
cancers, monitoring and early detection of relapse following treatment,
monitoring response to therapy, selecting patients for post-operative
chemotherapy or radiation therapy, in selecting mode of therapy,
and as vaccines. This sequence corresponds to one of the proteins used
for the detection method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Detecting an ovarian cancer-associated transcript in a cell from a patient, comprises contacting a biological sample from the patient with a polynucleotide that hybridizes to an ovarian cancer gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                      cytostatic; gene therapy; vaccine; ovarian cancer; diagnosis; post-operative chemotherapy; radiation therapy; tumour prognosis; pre-cancerous lesion detection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     100.0%; Score 40; DB 7; Length 253;

The present sequence is human stratum corneum chymotryptic enzyne (HSCEB), a member of the kallikrein multi-gene family. Kallikreins and kallikrein-like proteins are a subgroup of the serine proteins enzyme family. They catalyse the selective cleavage of specific polypeptide precursors to release peptides with potent biological activity. Nucleic cids encoding kallikrein-like proteins KKL*Li, KKK-Li, KKK
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human gastric cancer associated antigen protein sequence SEQ ID NO:942.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New kallikrein-like (KLK-L) proteins for diagnosing and treating KLK-L protein mediated disorders, especially cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

AAF22422 to AAF22626, AAF22627 to AAF22773 and AAF22774 to AAF23014 prepresent nucleotide sequences encoding human breast, gatarric and prostate cancer associated antigen precursors (CAAP) respectively.

AAB63232 to AAB63467, AAB63468 to AAB63721 and AAB63722 to AAB63970 represent human breast, gastric and prostate CAAP protein sequence respectively. CAAPs have cytostatic activity and can be used in the production of cancer vaccines. The human CAAP proteins, peptides, nucleic acids or anti-CAAP antibodies are useful for diagnosing and treating a condition characterised by expression of an abnormal amount of a protein, e.g. cancer
Nucleic acids encoding breast, gastric and prostate cancer associated antigen precursors, useful for diagnosing and treating a condition characterized by expression of an abnormal amount of a protein, e.g. cancer.
                                                                                                                                                                                                                                                                                    Example 1; Page 625; 799pp; English.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 2. Application US/08930188

Sequence 2. Application US/08930188

Patent No. 6093397

GENERAL INFORMATION:

APPLICANT: Dixton, Eric P.
APPLICANT: Little, Sheila P.
TITLE OF INVENTION: AMYLOID PRECURSOR PROTEIN PROTEASE AND TITLE OF INVENTION: AMYLOID PRECURSOR PROTEIN PROTEASE AND TITLE OF INVENTION: RELATED NUCLEIC ACIDS

NUMBER OF SEQUENCES: 3
CORRESPONDENCE BILLILILY and Company
STREET: Lilly Corporate Center
CITY: Indiana
CONTRY: United States of America
ZIP: Ad6285.
ADDRESSEE: Ell Lilly and Company
STREET: Lilly Corporate Center

Patent No. 6551795

GENERAL INFORMATION:
APPLICANT: Marc J. Rubenfield et al.
APPLICANT: Marc J. Rubenfield et al.
TITLE OF INVENTION: NUCLEIC AID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: 107196.13 6
CURRENT APPLICATION NUMBER: US 60/074,788
PRIOR APPLICATION NUMBER: US 60/074,788
PRIOR FILING DATE: 1998-02-18
PRIOR FILING DATE: 1998-02-18
PRIOR FILING DATE: 1998-07-27
SEQ ID NOS: 33142
SEQ ID NOS: 33142
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         0; Gaps

GENERAL INFORMATION

APPLICANT: Cannon, Martin J.

APPLICANT: Cannon, Martin J.

APPLICANT: Santin, Alessandro

TITLE OF INVENTION: Methods for the early diagnosis of ovarian cancer;

FILE REPERENCE: D6223CIP/C/D/CIP

CURRENT FILING DATE: 2001-07-30

PRIOR FILING DATE: 2001-07-30

PRIOR FILING DATE: 2001-07-13

NUMBER OF SEQ ID NOS: 136

heretocarcinogenesis-related transcription factor - rat
Cispecies: Rattus norvegicus (Norway rat)
Cispecies: Rattus norvegicus (Norway rat)
Cispecies: Rattus norvegicus (Norway rat)
Ciscession: UC4857
Rickensesion: UC4857
Rickishimoto, T.; Kokura, K.; Kumagai, Y.; Makino, Y.; Tamura, T.
Rickishimoto, T.; Kokura, Commun. 224, 746-751, 1996
A.Title: HTF: A b-zip transcription factor that is closely related to the human XBP/TREB:
A;Reference number: UC4857
A;Accession: UC4857
A;Molecule type: mRNA
A;Residues: 1-267 <KIS>
C;Comment: This is a basic-leucine zipper type transcription factor involved in hepatocel

cleaves insulin B chain at 6-Leu-|-Cys-7, 16-Tyr-|-Leu-17, 25-Phe-
|-Tyr-26, and 26-Tyr-|-Thr-27. Could play a role in the activation
of precursors to inflammatory cytokines.
-!- TISSUE SPECIPICITY: Abundantly expressed in the skin and is
expressed by Kerachinocytes in the epidermis. Very low levels are
also seen in the brain and kidney.
-!- SIMILARITY: Belongs to peptidase family S1. Kallikrein subfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CHARGE RELAY SYSTEM (BY SIMILARITY).

INHIBIN A IS A DIMER OF ALPHA AND BETA-A.
INHIBIN B IS A DIMER OF ALPHA AND BETA-B.
-i- SIMILARITY: Belongs to the TGF-beta family.
                                                                                                                                 FK506 BINDING PROTEIN 11.

Young N.M., Leon M.A.;
Theo marbohydrate specificity of conglutinin and its homology to proteins in the hepatic lectin family.";
Biochem. Biophys. Res. Commun. 143:645-651(1987).
-: FUNCTION: Calcium-dependent lectin-like protein which binds to a yeast cell wall extract and immune complexes through the complement component (C3bi). It is capable of binding nonreducing terminal N-acetylglucosamine, mannose, and fucose residues.
-: SUBUNIT: Oligomeric complex of 4 set of homotrimers.
-: SIMILARITY: Contains 1 Collagenous domain.

-!-SUBURIT. Interacts with MUSK, with F-actin via its N-terminal domain, and with LMMA in vitro (By similarity).
-!-SUBCELLULAR LOCATION: Type IV membrane protein (Potential). The largest part of the protein is gyroplasmic, while its C-terminal part is associated with the nuclear envelope, most probably the outer nuclear membrane. In skeletal and smooth muscles, a significant amount is found in the sarcomeres.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              prediction.
CAUTION: Ref.7 (BAB71097) sequence differs from that shown due

-1- SIMILARITY: Belongs to the nesprin family.
-1- SIMILARITY: Contains 1 actin-binding domain.
-1- SIMILARITY: Contains 2 calponin-homology (CH) domains.
-1- SIMILARITY: Contains 12 HAT repeats.
-1- SIMILARITY: Contains 1 Klarsicht domain.
-1- SIMILARITY: Contains 31 spectiful repeats.

"TOAR Proteins with substitutions in residues conserved with OmpR
fail to activate transcription from the cholera toxin promoter.";
J. Bacteriol. 174:6807-6814(1992).
-! FUNCTION: THIS TRANSCRIPTION ACTIVATOR CONTROLS CHOLERA TOXIN,
VIBRIO CHOLERAE. IT BINDS TO THE 5'-TITIGAT-3' TANDEMLY REPEATED
DNA SEQUENCE IN CHOLERA TOXIN PRONOTER REGION. TOXS. INTERACTS WITH
THE C-TERMINAL PERIPLASMIC DOMAIN OF TOXR, STIMULATING ITS
ACTIVITY. IT ACTIVATES TRANSCRIPTION AT THE PROMOTERS FOR TCPI AND
TCPA AND THIS IS PRESUMABLY VIA FORT.
-!- SIMILARITY: TO B. COLI CADC, AND TO THE C-TERMINI OF A GROUP OF
TRANSCRIPTIONAL ACTIVATORS (OMPR-LIKE PROTEINS).
                                                                                                                                                                                                                                      Parsot C., Mekalanos J.J.,
"Expression of ToxR, the transcriptional activator of the virulence
factors in Vibrio cholerae, is modulated by the heat shock
                                                                                                                                                                                                                                                                                                                                                                                                                                               SEQUENCE OF 263-294 PROM N.A. Biol. Chem. 277:44195-44201(2002).

J. Biol. Chem. 277:44195-44201(2002).

General Chem. 277:44195-44201(2002).

Gamma-secretase processed fragment, ALIDI, activates transcription activation through APBBI (Fe65) binding. Couples to JIP signal transduction through C-terminal binding. May interact with cellular G-protein signaling pathways. Can regulate neurite outgrowth through binding pathways. Can regulate neurite outgrowth through binding to components of the extracellular cellular G-protein signaling pathways. Can regulate neurite cellular gamma-CTF peptide, C30, is a potent enhancer of neuronal apoptosis (By similarity).

J. SUBMITT Binds, Via its C-terminal, to the PID domain of several cytoplasmic proteins, including APBB and APBB family members, MAPKBIP1 and Dabl (By similarity). Binding to Dabl inhibits its serine phosphorylation.

J. SUBCELULAR LOCATION: Type I membrane protein. C-terminally processed in the Golgi complex.

J. DOMAIN: The NRYX sequence motif found in many tyrosine-
